

<html>

# <html>

- “HyperText Markup Language”
- Not a programming language
- Stored in text files (just like Perl)
  - On a server
  - Downloaded, interpreted and displayed by a web browser (e.g. Chrome or Firefox)

# A basic page

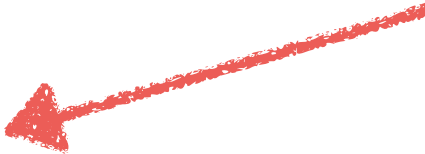

# A basic page

```
<!doctype html>
<html>
  <head>
    <title>P4B 2016</title>
  </head>
  <body>
    Programming For Biology 2016
  </body>
</html>
```

# Doctype

Doctype

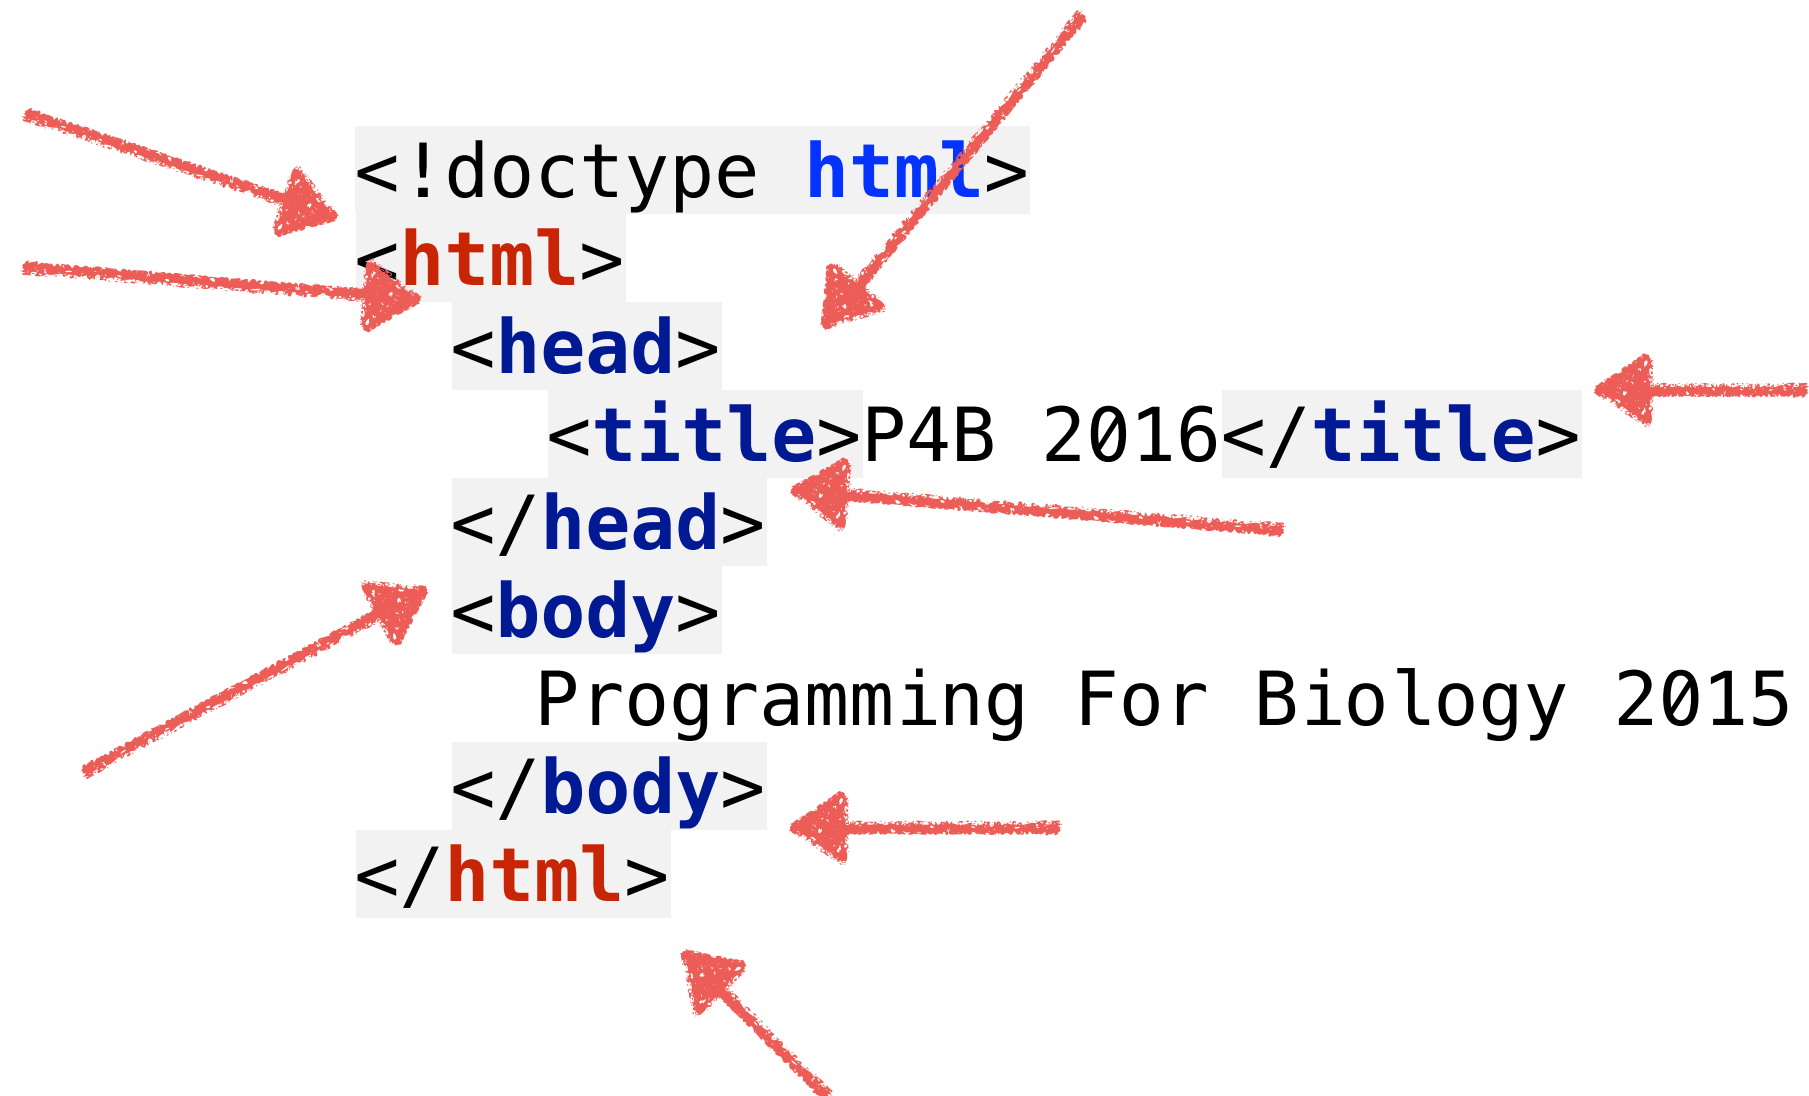

```
<!doctype html>  
<html>  
  <head>  
    <title>P4B 2016</title>  
  </head>  
  <body>  
    Programming For Biology 2016  
  </body>  
</html>
```

The doctype declaration is used by web browsers

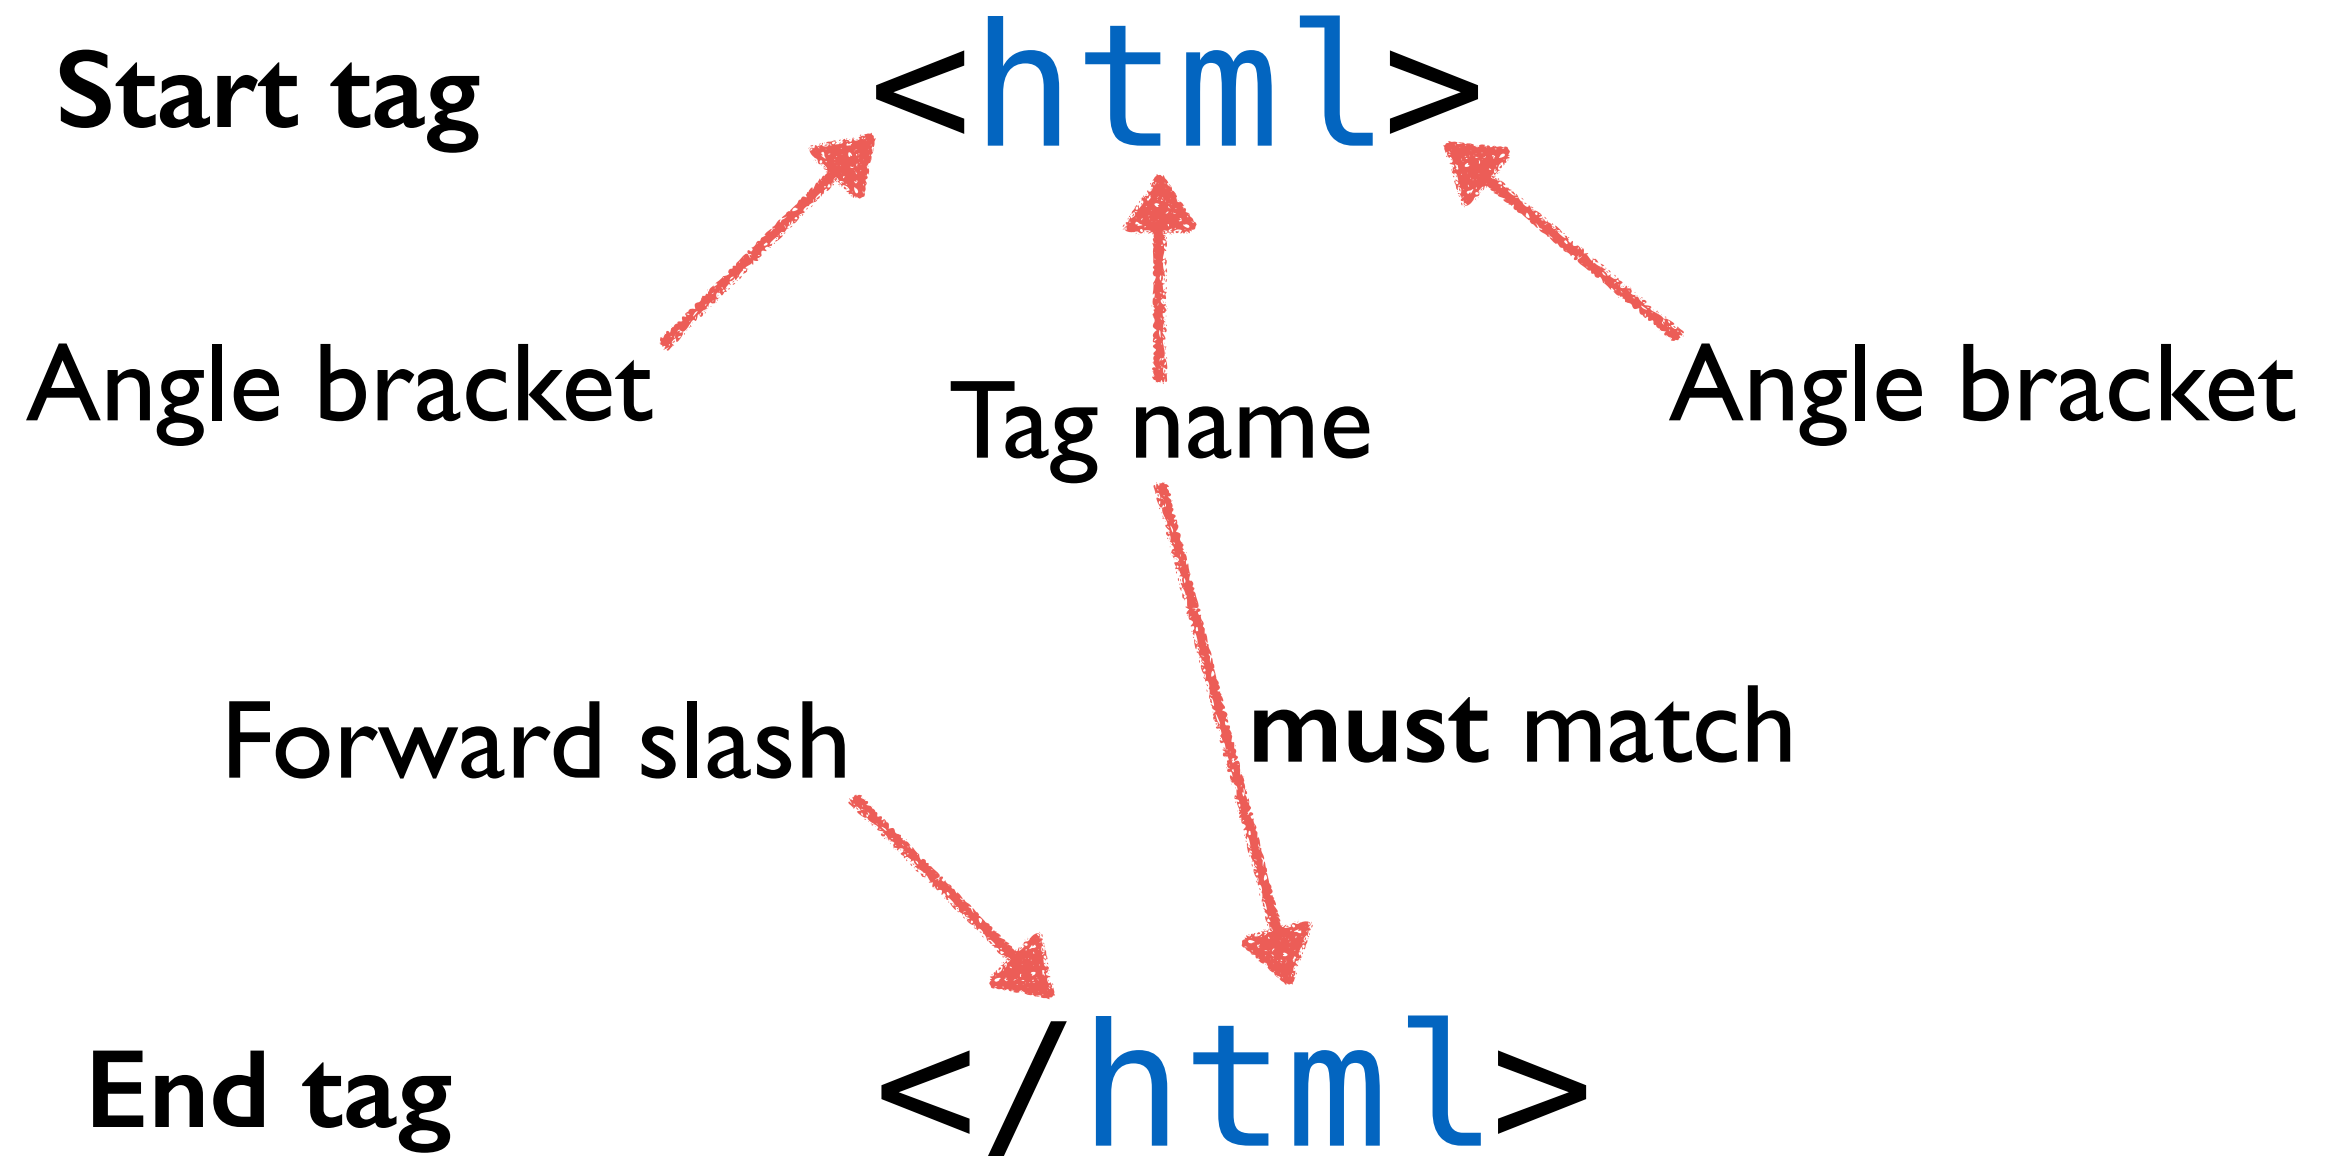

It declares that this file aspires to be correct HTML

# Elements

They provide **context** for their contents

# Anatomy of an element

# Elements

```
<!doctype html>  
<html>  
  <head>  
    <title>P4B 2016</title>  
  </head>  
  <body>  
    Programming For  
    Biology 2016  
  </body>  
</html>
```

They **nest** and **balance** (like {braces} in perl)

# A basic page

```
<!doctype html>  
<html>  
  <head>  
    <title>P4B 2016</title>  
  </head>  
  <body>  
    Programming For  
    Biology 2016  
  </body>  
</html>
```

All pages have `<html>`, `<head>` and `<body>`

`<html>`

Surrounds the entire document  
(except the doctype)

`<head>`

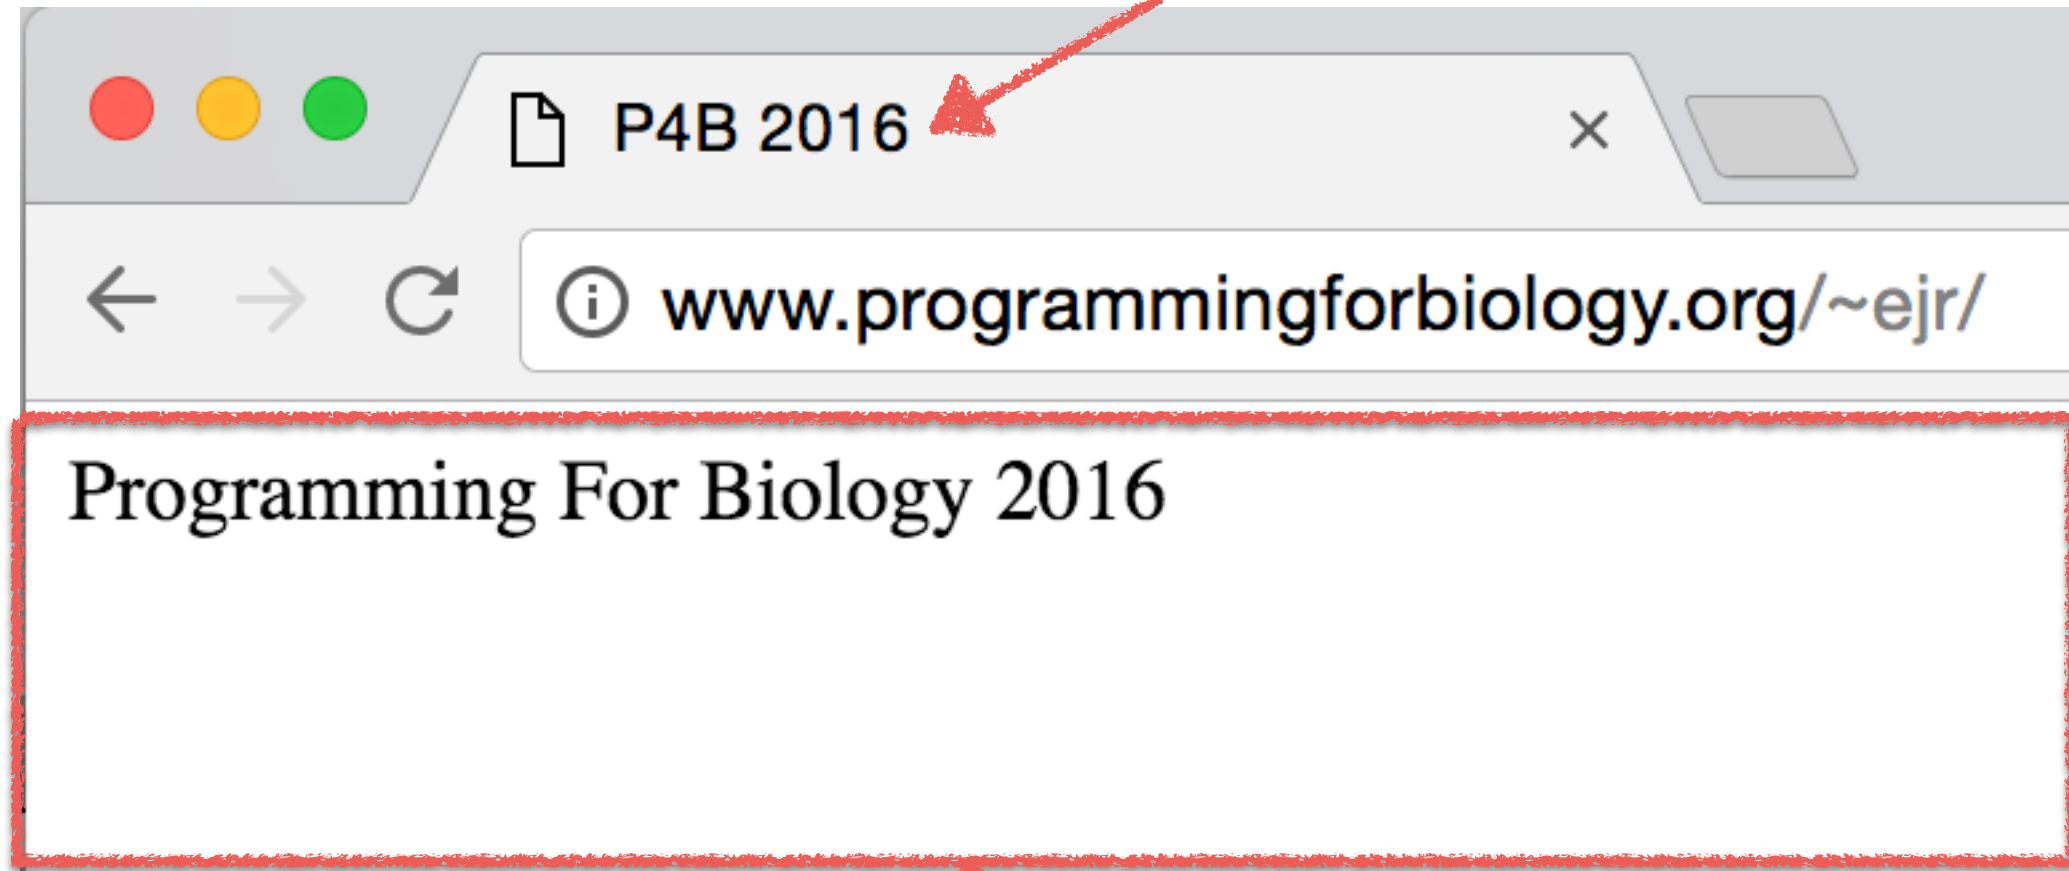

Contains metadata about the page  
e.g. the page `<title>`

`<body>`

The part of the page that is displayed

# A basic page

Page `<title>` (from `<head>`)

Contents of `<body>`

# Text elements

## Heading tag

`<h1>This is a top level heading</h1>`  
`<h6>This is the bottom level heading</h6>`

**This is a top level heading**

**This is the bottom level heading**

## Paragraph tag

`<p>This is definitely a paragraph</p>`

This is definitely a paragraph

## Emphasis and Strong

That's `<em>exactly</em>` what I mean – I am `<strong>sick</strong>` of this slide

That's *exactly* what I mean - I am **sick** of this slide

## Comment Tag

`<!-- This is a comment. You won't see this on the web-->`

# Lists

Two kinds:-

`<ol>`

Ordered list; numbered items

`<ul>`

Unordered list; bulleted items

Each may only contain:-

`<li>`

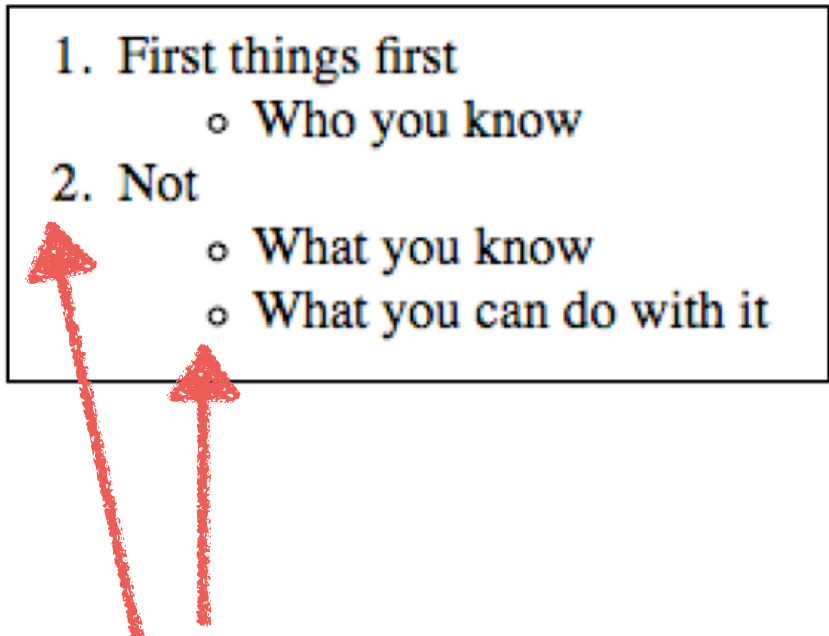

A list item

# Lists

```
<ol>  
  <li>  
    <h4>First things first</h4>  
    <ul>  
      <li>Who you know</li>  
    </ul>  
  </li>  
  <li>  
    <h4>Not</h4>  
    <ul>  
      <li>What you know</li>  
      <li>What you can do with it</li>  
    </ul>  
  </li>  
</ol>
```

Lists may be nested

output:

- 
1. First things first
    - Who you know
  2. Not
    - What you know
    - What you can do with it

Numbers, bullets and  
indentation added by  
web browser

# Link and attributes

Attributes describe an element but are not displayed

```
<a href="http://nytimes.com">
```

Attribute Name                      Attribute Value

# Links

“HTML Anchor element”

Absolute `<a href="http://nytimes.com">The New York Times</a>`  
[The New York Times](http://nytimes.com)

Relative `<a href="another_page.html">On The Same Site</a>`

Internal `<a href="#faq">On The Same Page</a>`

`<h2 id="faq">FAQs</h2>`

# Images

`img`

Image tag name

`src`

URL of image file

`alt`

Text description of image

```

```

# Tables

`<table>`

This surrounds the entire table

`<tr>`

A table row

Every row in the table needs one of these

A table row contains cells.

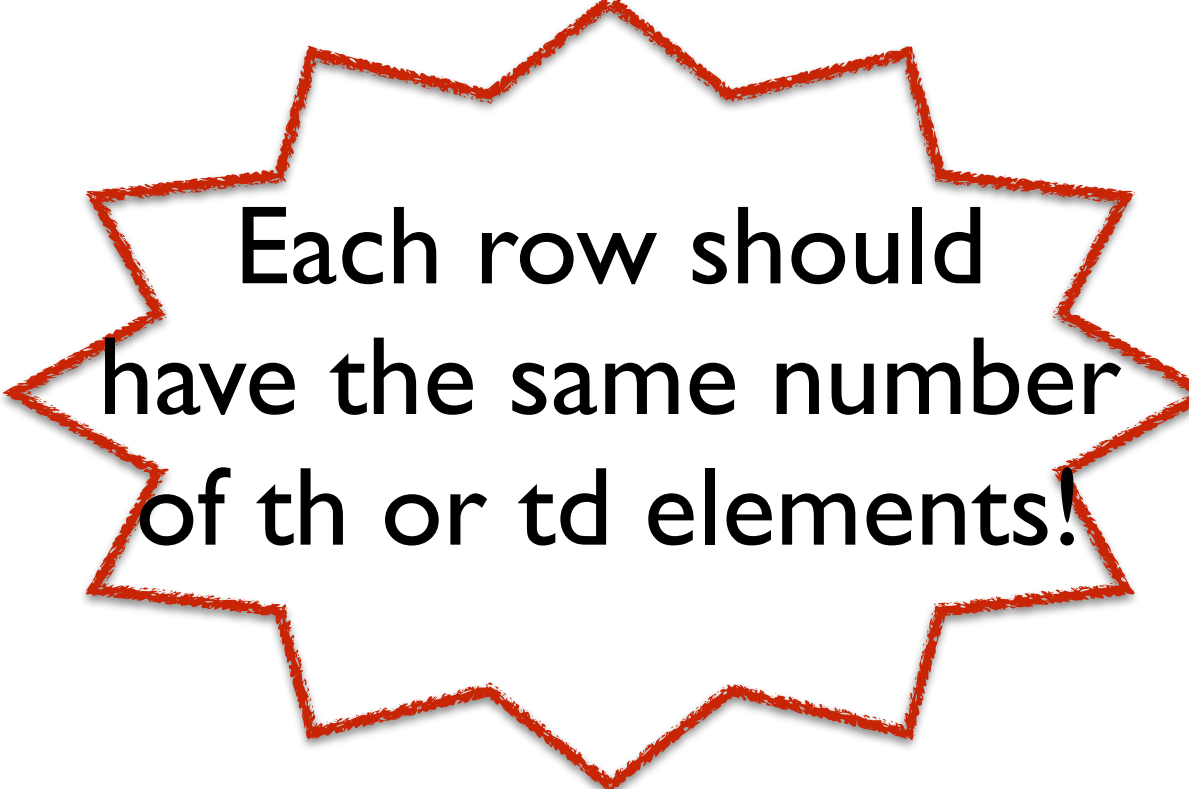

Two cell tags:-

`<th>`

Header item

`<td>`

Data item

Each row should have the same number of th or td elements!

# Tables

```
<table>
```

```
<tr>
```

```
<th>ID</th>
```

```
<th>Length</th>
```

```
<th>Sequence</th>
```

```
</tr>
```

```
<tr>
```

```
<td>M12277.1</td>
```

```
<td>22</td>
```

```
<td>CAACCCCCCGCCCTCAGATCCC</td>
```

```
</tr>
```

```
<tr>
```

```
<td>X83548.1</td>
```

```
<td>21</td>
```

```
<td>CAAAGGAGGCGCTAAGCGCCA</td>
```

```
</tr>
```

```
</table>
```

ID	Length	Sequence
M12277.1	61	CAACCCCCCGCCCTCAGATCCCTAATCCCATCGCAAGCATCAGACTCCCTCCAAAGCAGGC
X83548.1	21	CAAAGGAGGCGCTAAGCGCCA

# Forms

```
<form name="yourname" action="handleMyForm.pl">
```

```
</form>
```

Forms allow browsers to send data entered by a user to the server

The **action** attribute specifies the URL that will receive the data

# Forms

```
<form name="yourname" action="handleMyForm.pl">
```

```
  <input type="text" name="firstname" />
```

```
  <input type="text" name="lastname" />
```

```
</form>
```

output:

# Forms

```
<form name="yourname" action="handleMyForm.pl">  
  <label for="fname">First name:</label>  
  <input id="fname" type="text" name="firstname" />
```

```
  <label for="lname">Last name:</label>  
  <input id="lname" type="text" name="lastname" />
```

```
</form>
```

output:

First name:  Last name:

# Forms

```
<form name="yourname" action="handleMyForm.pl">  
  <label for="fname">First name:</label>  
  <input id="fname" type="text" name="firstname" />  
  
  <label for="lname">Last name:</label>  
  <input id="lname" type="text" name="lastname" />  
  
  <input type="submit" value="Submit" />  
</form>
```

output:

First name:  Last name:

(There are many other **types** of **<input>**)

# Forms

```
<form name="yourname" action="handleMyForm.pl">  
  <label for="fname">First name:</label>  
  <input id="fname" type="text" name="firstname" />  
  
  <label for="lname">Last name:</label>  
  <input id="lname" type="text" name="lastname" />  
  
  <input type="submit" value="Submit" />  
</form>
```

output:

First name:  Last name:

1. Package up every **<input>** with a **name** attribute
2. Send it to the URL in the **<form>**'s **action**

# Organizing content with tags

- Sometimes you need to organize content but a table or list is not appropriate

`<div>`

Define a **block** of content

`<span>`

Mark a piece of content **inline**

`<section>`

`<aside>`

`<footer>`

`<nav>`

“Semantic tags”: Define a block of content more descriptively.

Recently introduced; not in IE8

# Organizing content with attributes

**id** Must be unique on the page

**class** Groups related information  
A tag can have many classes  
separated by spaces

These are the most important,  
most commonly used attributes

# Organized Content

```
<table>
  <tr>
    <th>ID</th>
    <th>Length</th>
    <th>Sequence</th>
  </tr>

  <tr>
    <td>M12277.1</td>
    <td>22</td>
    <td>CAACCCCCCGCCCTCAGATCCC</td>
  </tr>

  <tr>
    <td>X83548.1</td>
    <td>21</td>
    <td>CAAAGGAGGCGCTAAGCGCCA</td>
  </tr>
</table>
```

# Organized Content

output:

## Results

ID	Length	Sequence
M12277.1	61	CAACCCCCCGGATCCTCAGATCCC
X83548.1	21	CAAAGGAGGGATCCAAGCGCCA

```
<table>
  <tr>
    <th>ID</th>
    <th>Length</th>
    <th>Sequence</th>
  </tr>
```

```
<tr>
  <td>M12277.1</td>
  <td>61</td>
  <td class="sequence">CAACCCCC<span class="motif">GGATCC</span>TCAGATCCC</td>
</tr>
```

```
<tr>
  <td>X83548.1</td>
  <td>21</td>
  <td class="sequence">CAAAGGAG<span class="motif">GGATCC</span>AAGCGCCA</td>
</tr>
</table>
```

# Cascading Style Sheets

- Help separate **content** from **appearance**
- You don't need to write your own!
  - Many excellent style sheets available to you
  - I like Twitter Bootstrap ([getbootstrap.com](http://getbootstrap.com))

# How CSS works

- Statements consist of
  - Selectors
    - *Which* element(s)?
  - Declarations
    - *What* will you do to them?

Selector

```
body {  
  background-color:  
}
```

```
background-color: orange;
```

A declaration

# CSS Example

```
.sequence {  
    font-family: monospace;  
}  
  
.motif {  
    color: orange;  
}
```

# HTML

```
<table>
  <tr>
    <th>ID</th>
    <th>Length</th>
    <th>Sequence</th>
  </tr>

  <tr>
    <td>M12277.1</td>
    <td>61</td>
    <td class="sequence">CAACCCCC<span class="motif">GGATCC</span>TCAGATCCC</td>
  </tr>

  <tr>
    <td>X83548.1</td>
    <td>21</td>
    <td class="sequence">CAAAGGAG<span class="motif">GGATCC</span>AAGCGCCA</td>
  </tr>
</table>
```

# CSS

+

```
.sequence {
  font-family: monospace;
}

.motif {
  color: orange;
}
```

## Results

ID	Length	Sequence
M12277.1	61	CAACCCCCGGATCCTCAGATCCC
X83548.1	21	CAAAGGAGGGATCCAAGCGCCA

# CSS Selectors

```
body {  
}
```

Match the “body” element

```
.motif {  
}
```

Match all elements  
with class=“motif”

```
#firstname {  
}
```

Match the element  
with id=“firstname”

# DIY

- There is a sample web site in your home directory

```
$ cd ~/public_html
```

- Take a look at `index.html`
- Then open your favorite browser and go to

<http://www.programmingforbiology.org/~<YOUR USER NAME>/>

# Scraping

- We can parse web pages like any other text
- Use `curl` or `wget` to download an html file

```
$ curl http://programmingforbiology.org | less  
$ wget http://programmingforbiology.org/index.html  
$ less index.html
```

```
#!/usr/bin/perl
# A quick script to parse PFAM search results
use strict;
use warnings;

my $search = shift;
system ("wget -q -O pfam_search.txt 'http://pfam.xfam.org/search/keyword?query="' . $search . "'");

open (FILE, "<", "pfam_search.txt") or die "Cannot open file: $!\n";

# create a hash of the ids in our web page
# We use a hash as an easy way to eliminate duplicates
my %pfam_ids;
while (my $line = <FILE>) {
    if ($line =~ /(PF\d+)/) {
        $pfam_ids{$1}++;
    }
}

# Print the IDs on one line
print join ("\t", $search, sort keys %pfam_ids), "\n";
```

</html>
