

Metagenomic Visualization

Using Visualization Tools Megan and Taxonomer

The Large Intestine

<http://ab.inf.uni-tuebingen.de/data/software/megan6/download/manual.pdf>

Taxonomer

- Go to web site: <https://www.taxonomer.com/>
- Login as me: b.cantarel@gmail.com
- Password pfb2016
- Select the Project PFB2016
- Select a 16S Sample For Comparison with Mother Results

The screenshot shows the Taxonomer web application interface. At the top is a navigation bar with links: Home, Projects, Analyses, Examples, Help, and a red 'Quick Analysis' button. A 'Logout (b.cantarel@gmail.com)' link is on the right. Below the navigation bar is a 'Get Started' section with three large buttons: 'Try an example analysis' (red), 'Analyze your sequencing data' (yellow), and 'Create a project' (blue). Below this is a 'Recent Analyses' table with columns: Name, Description, Project, Full Analysis Status, Created By, Date Created, Edit, and Delete. The table lists five analyses, all created by 'Brandi Cantarel' on '10/17/2016'. The first four are 'Pig 16S Ileum', 'Pig 16S Colon', 'Pig 16S Cecum', and 'WGS Colon', all with a status of 'Completed'. The fifth is 'WGS Ileum' with a status of 'In Progress'. Below the table is a 'Recent Projects' section with a table listing one project: 'PFB2016' (Programming for Biology 2016) with 8 analyses, created by 'Brandi Cantarel' on '10/17/2016'.

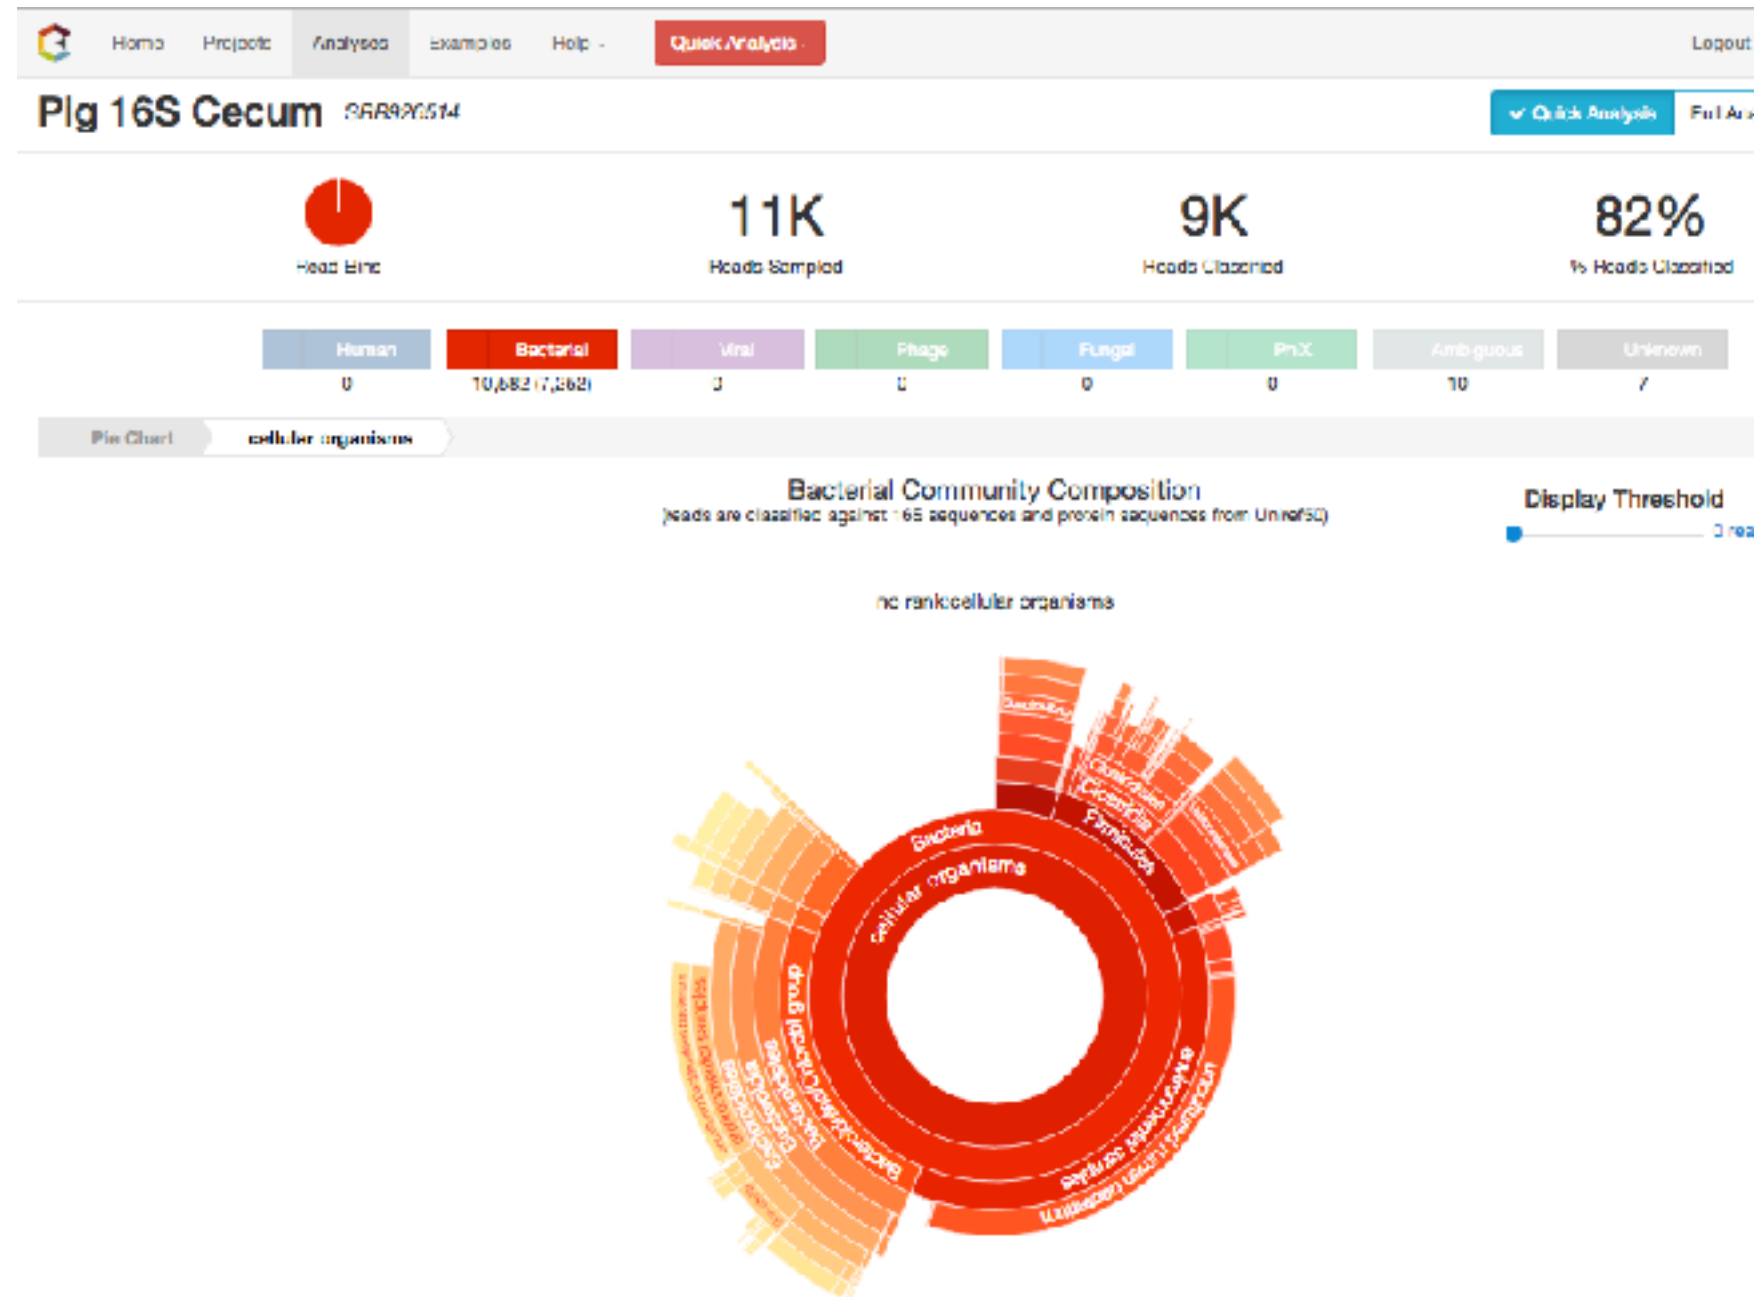

Name	Description	Project	Full Analysis Status	Created By	Date Created	Edit	Delete
Pig 16S Ileum	pig59_ileum_med_16S_illum	PFB2016	Completed	Brandi Cantarel	10/17/2016		
Pig 16S Colon	pig59_colon_med_16S_illum	PFB2016	Completed	Brandi Cantarel	10/17/2016		
Pig 16S Cecum	pig59_cecum_med_16S_illum	PFB2016	Completed	Brandi Cantarel	10/17/2016		
WGS Colon	pig59_colon_med_meta	PFB2016	Completed	Brandi Cantarel	10/17/2016		
WGS Ileum	pig59_ileum_med_meta	PFB2016	In Progress	Brandi Cantarel	10/17/2016		

Name	Description	# of Analyses	Created By	Date Created	Edit
PFB2016	Programming for Biology 2016	8	Brandi Cantarel	10/17/2016	

Also on iobio <http://taxonomer.iobio.io/>

Taxonomer

- You will see something similar to the page on the right
- You can hover over each classification to get the number of reads assigned or click to see the subset of the data

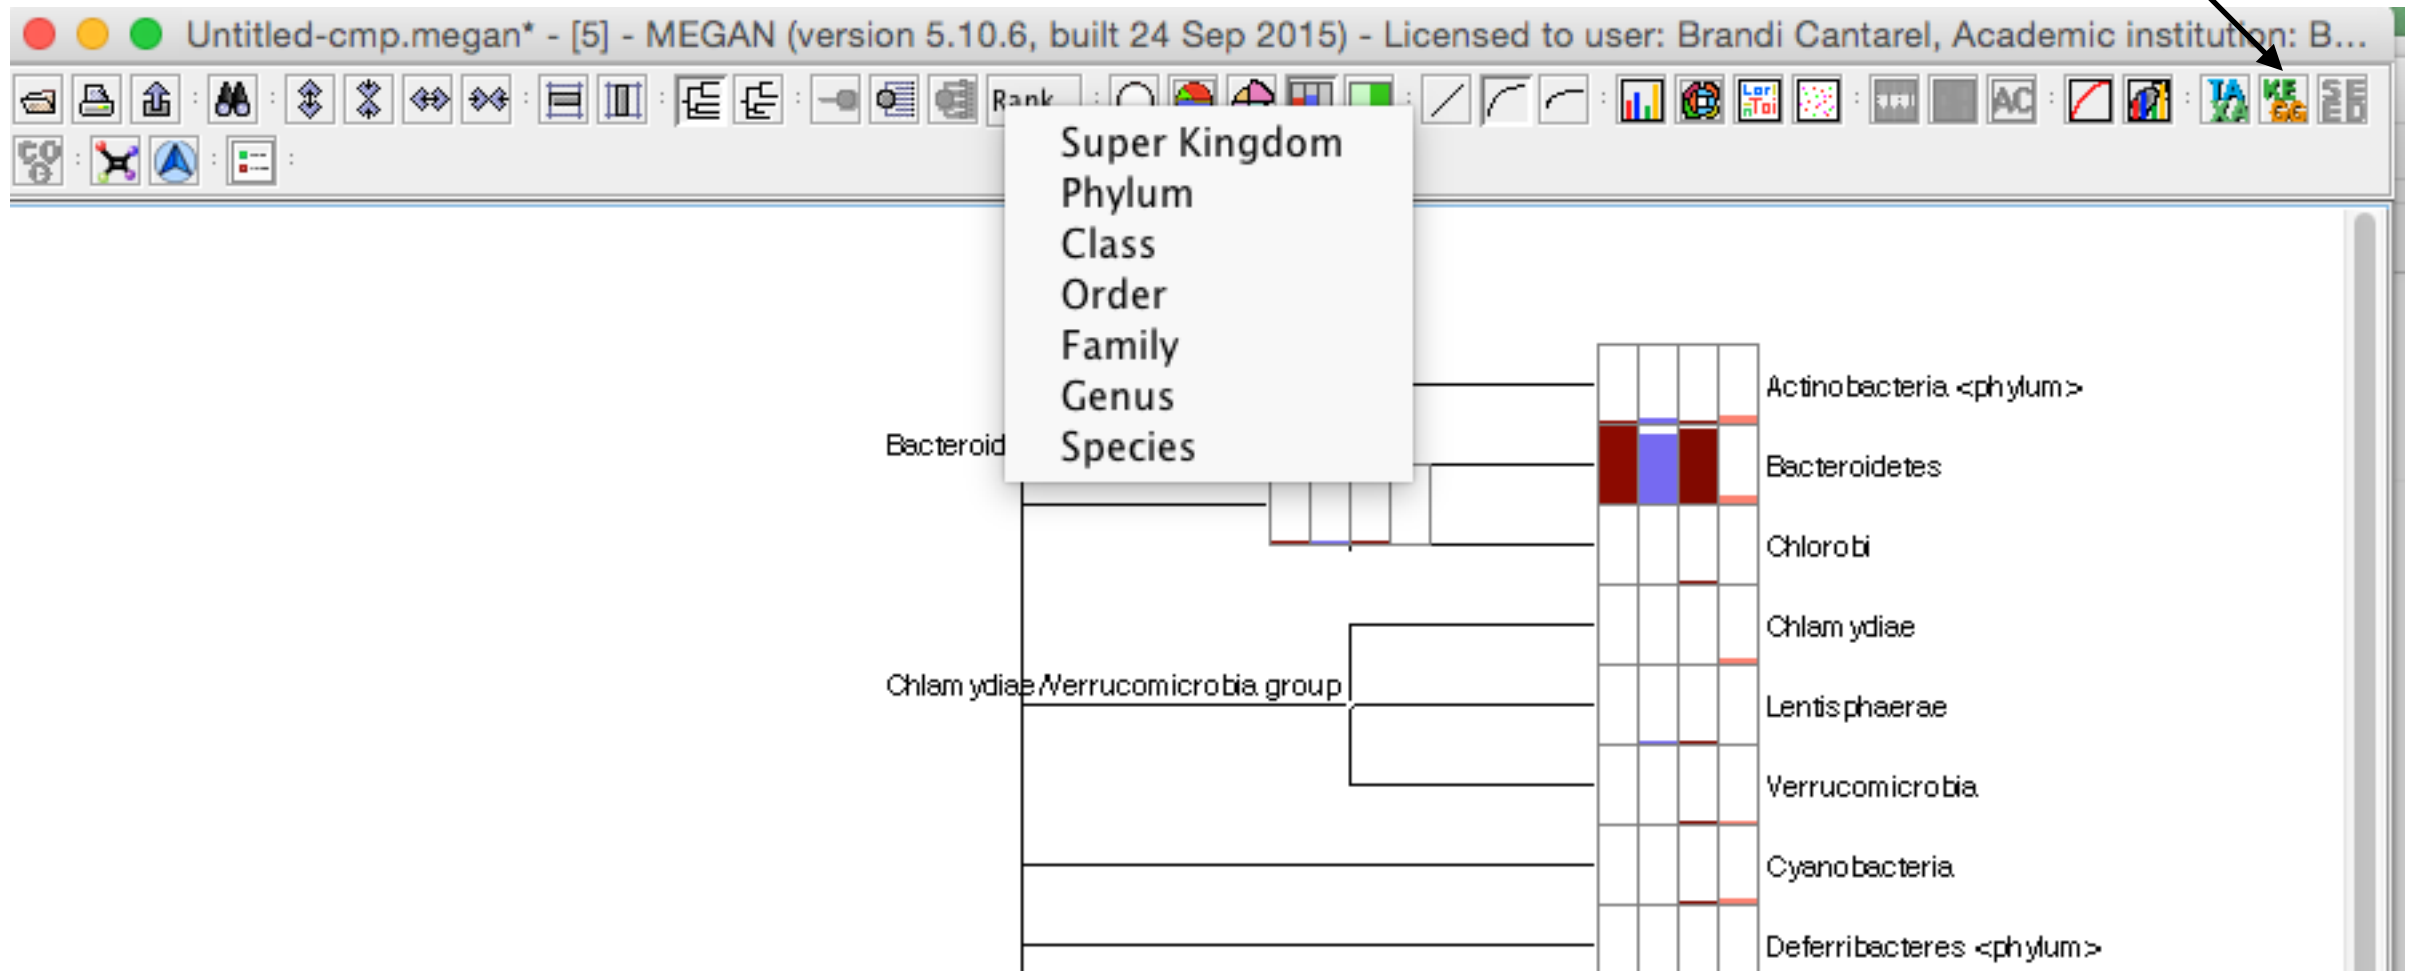

16S Taxonomic Comparison

- What are the dominate phyla, family and genera for each sample?
- Are sites that are closer (spatially) also closer taxonomically (use cluster analysis)?
- What fraction of each samples is “unclassified” taxonomically?
- Are the taxonomer results similar to the mothur results for your chosen sample?

Some Tool Options In Megan

Gene Annotation

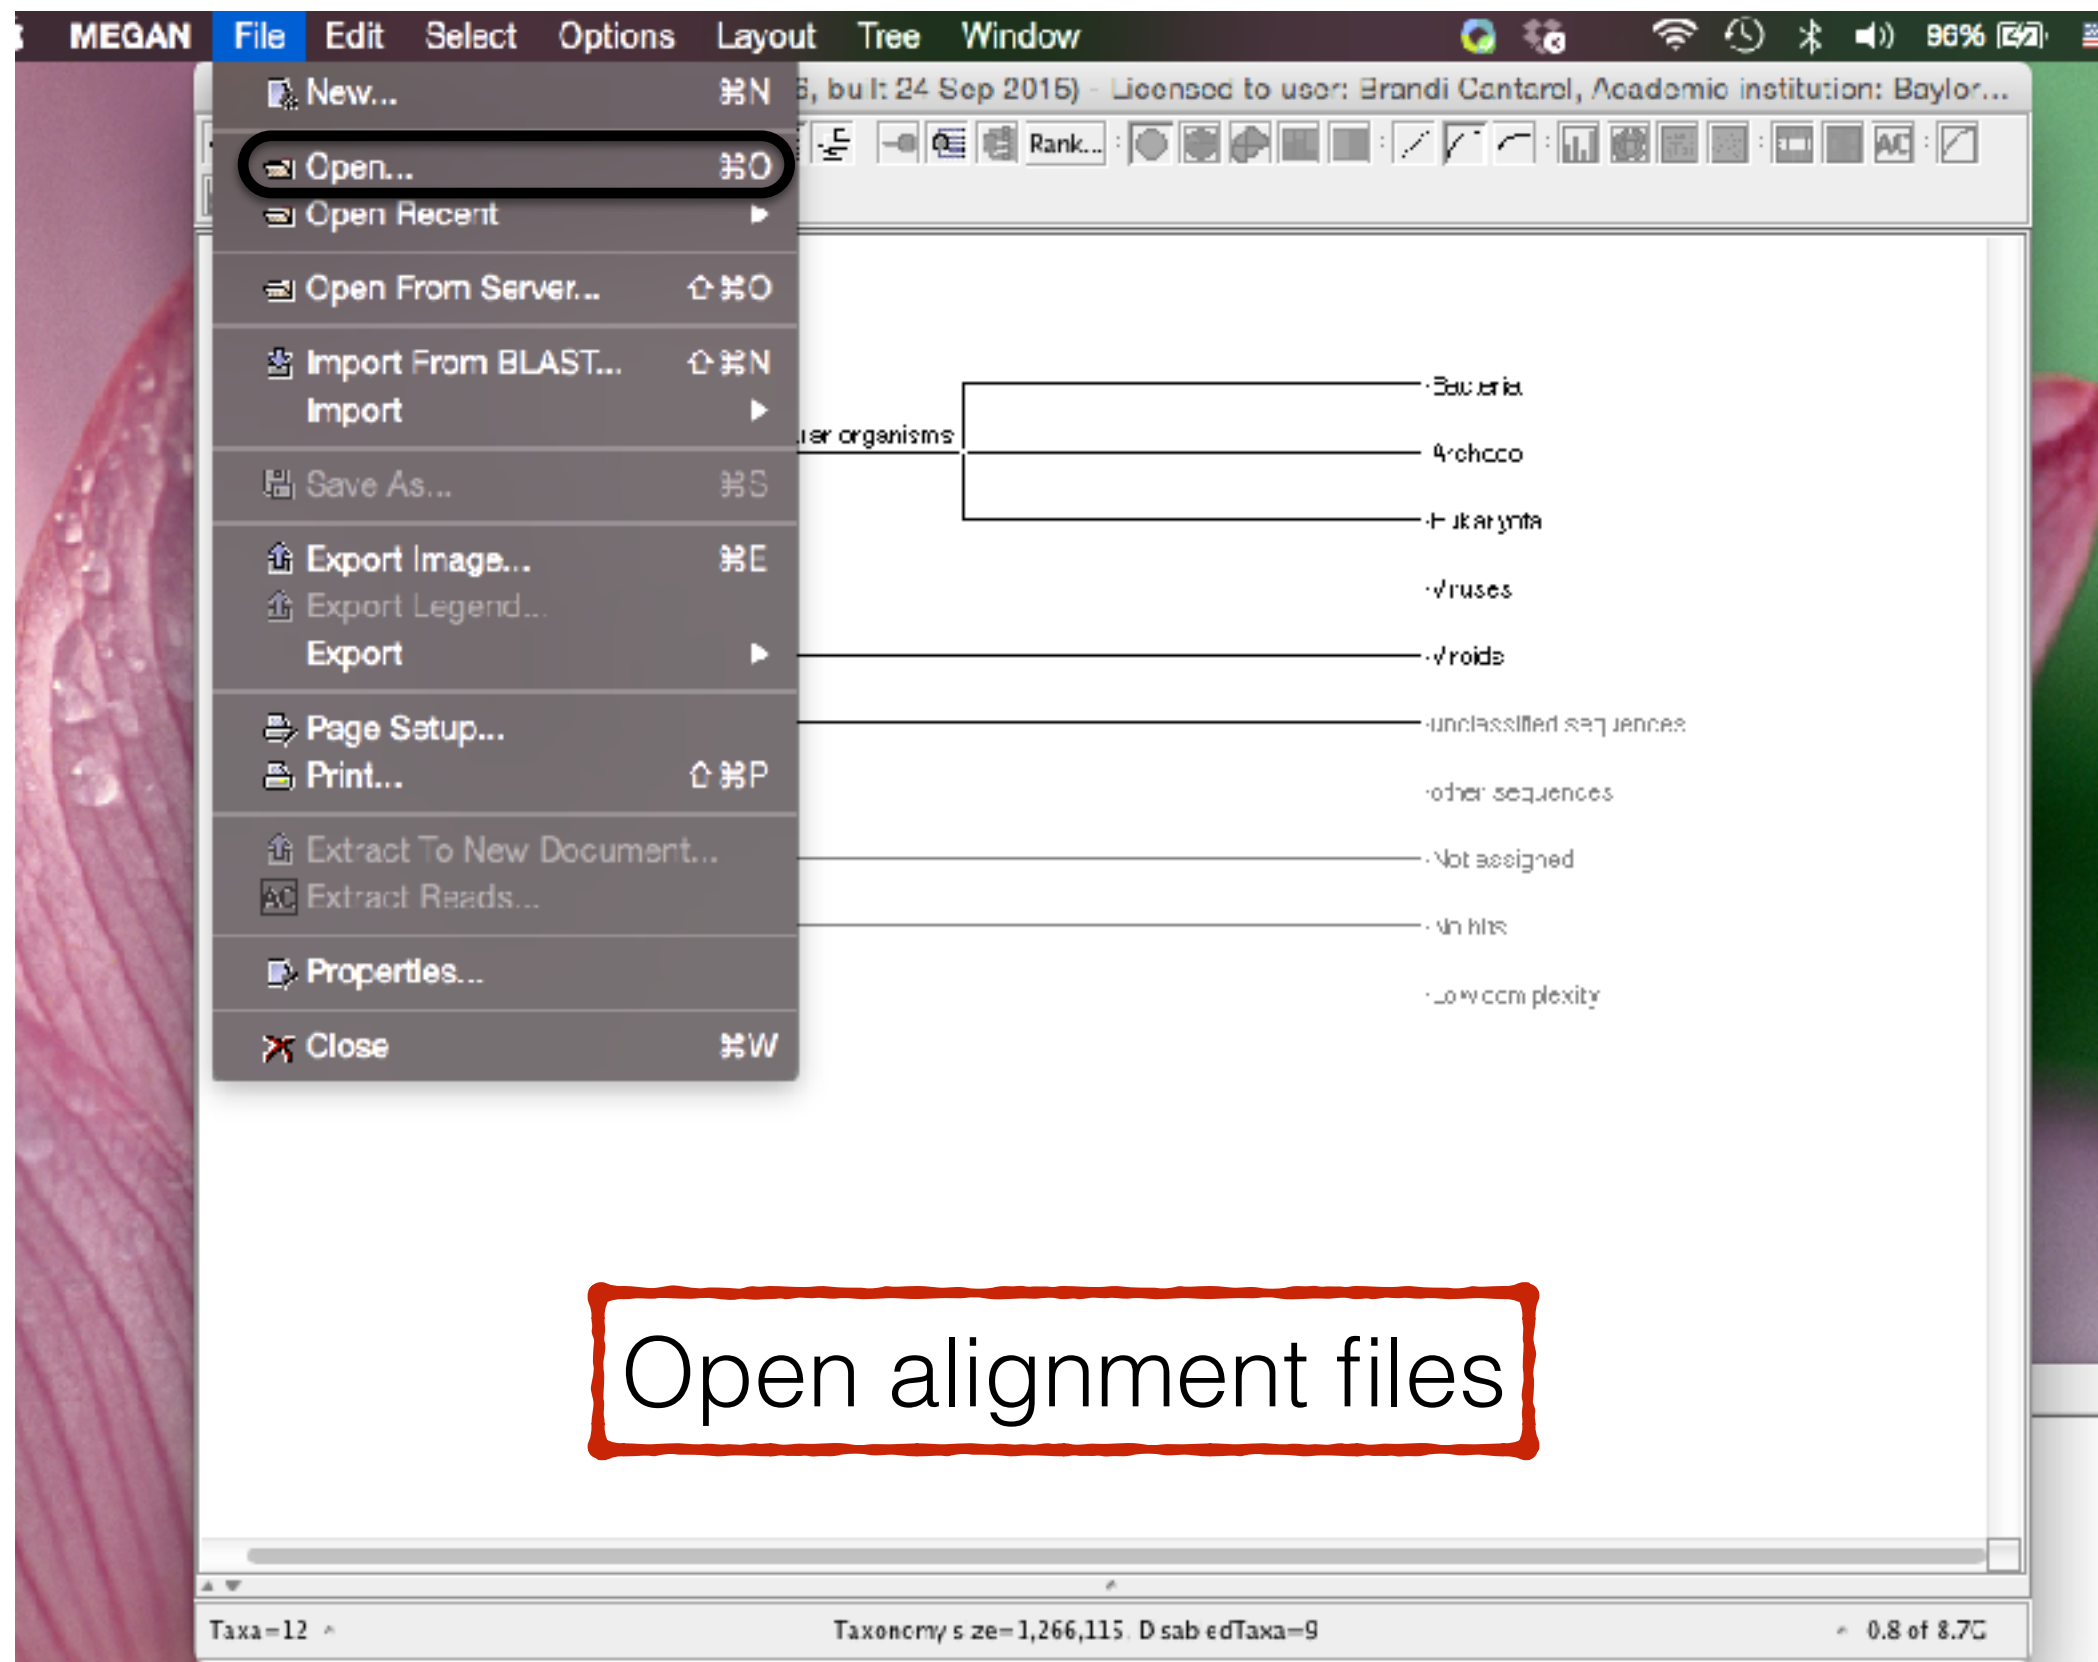

Organism Annotation

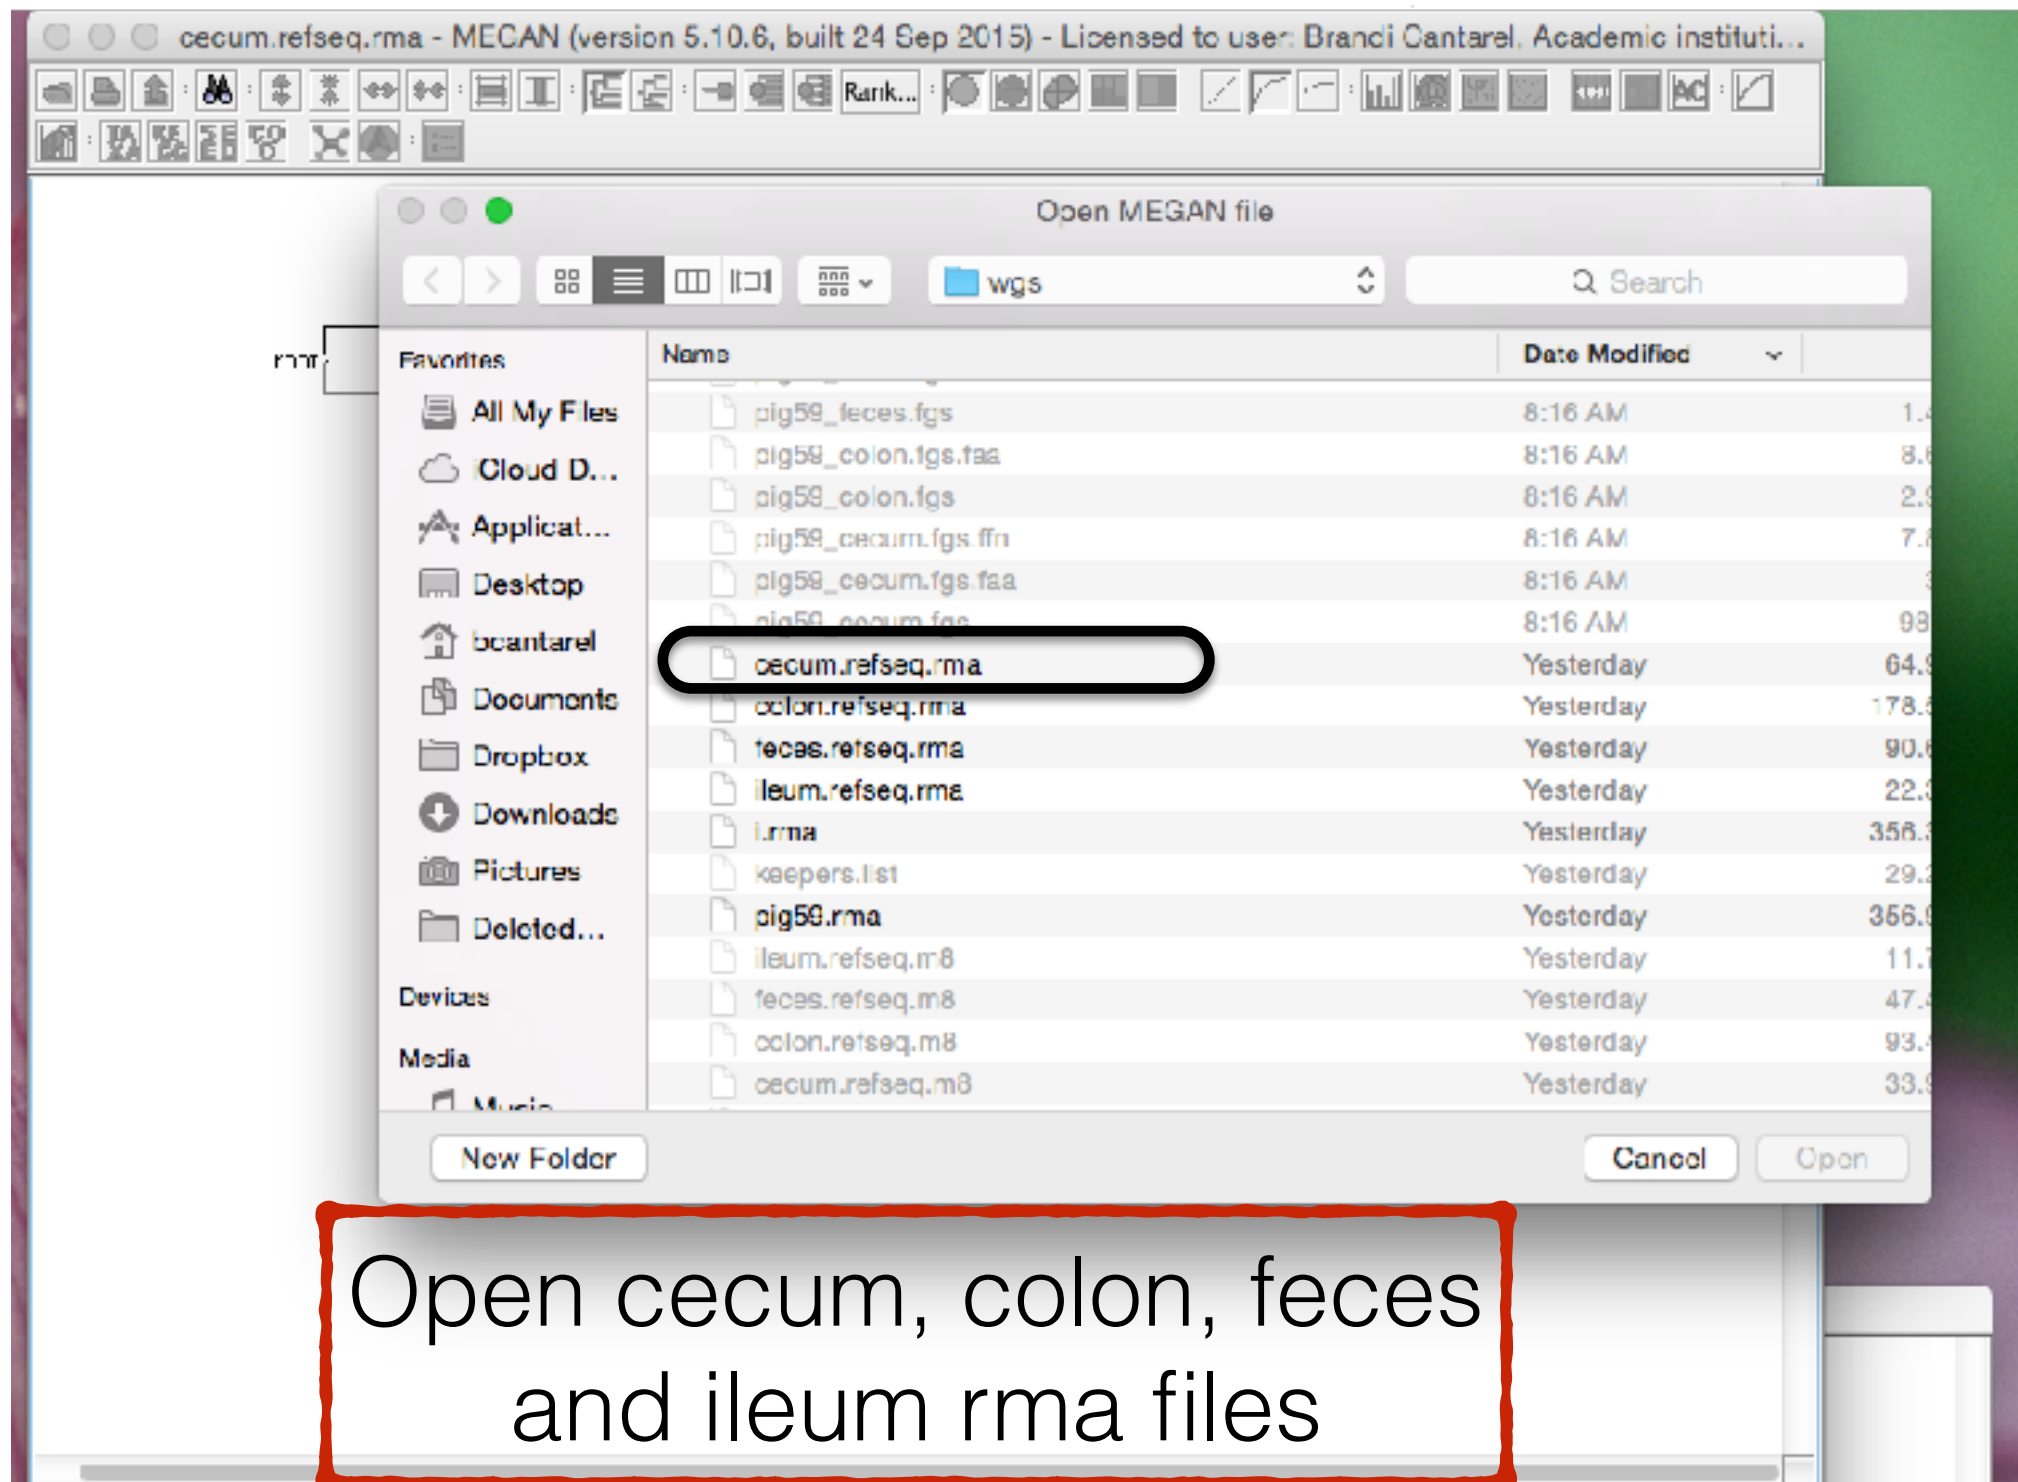

Rarefaction

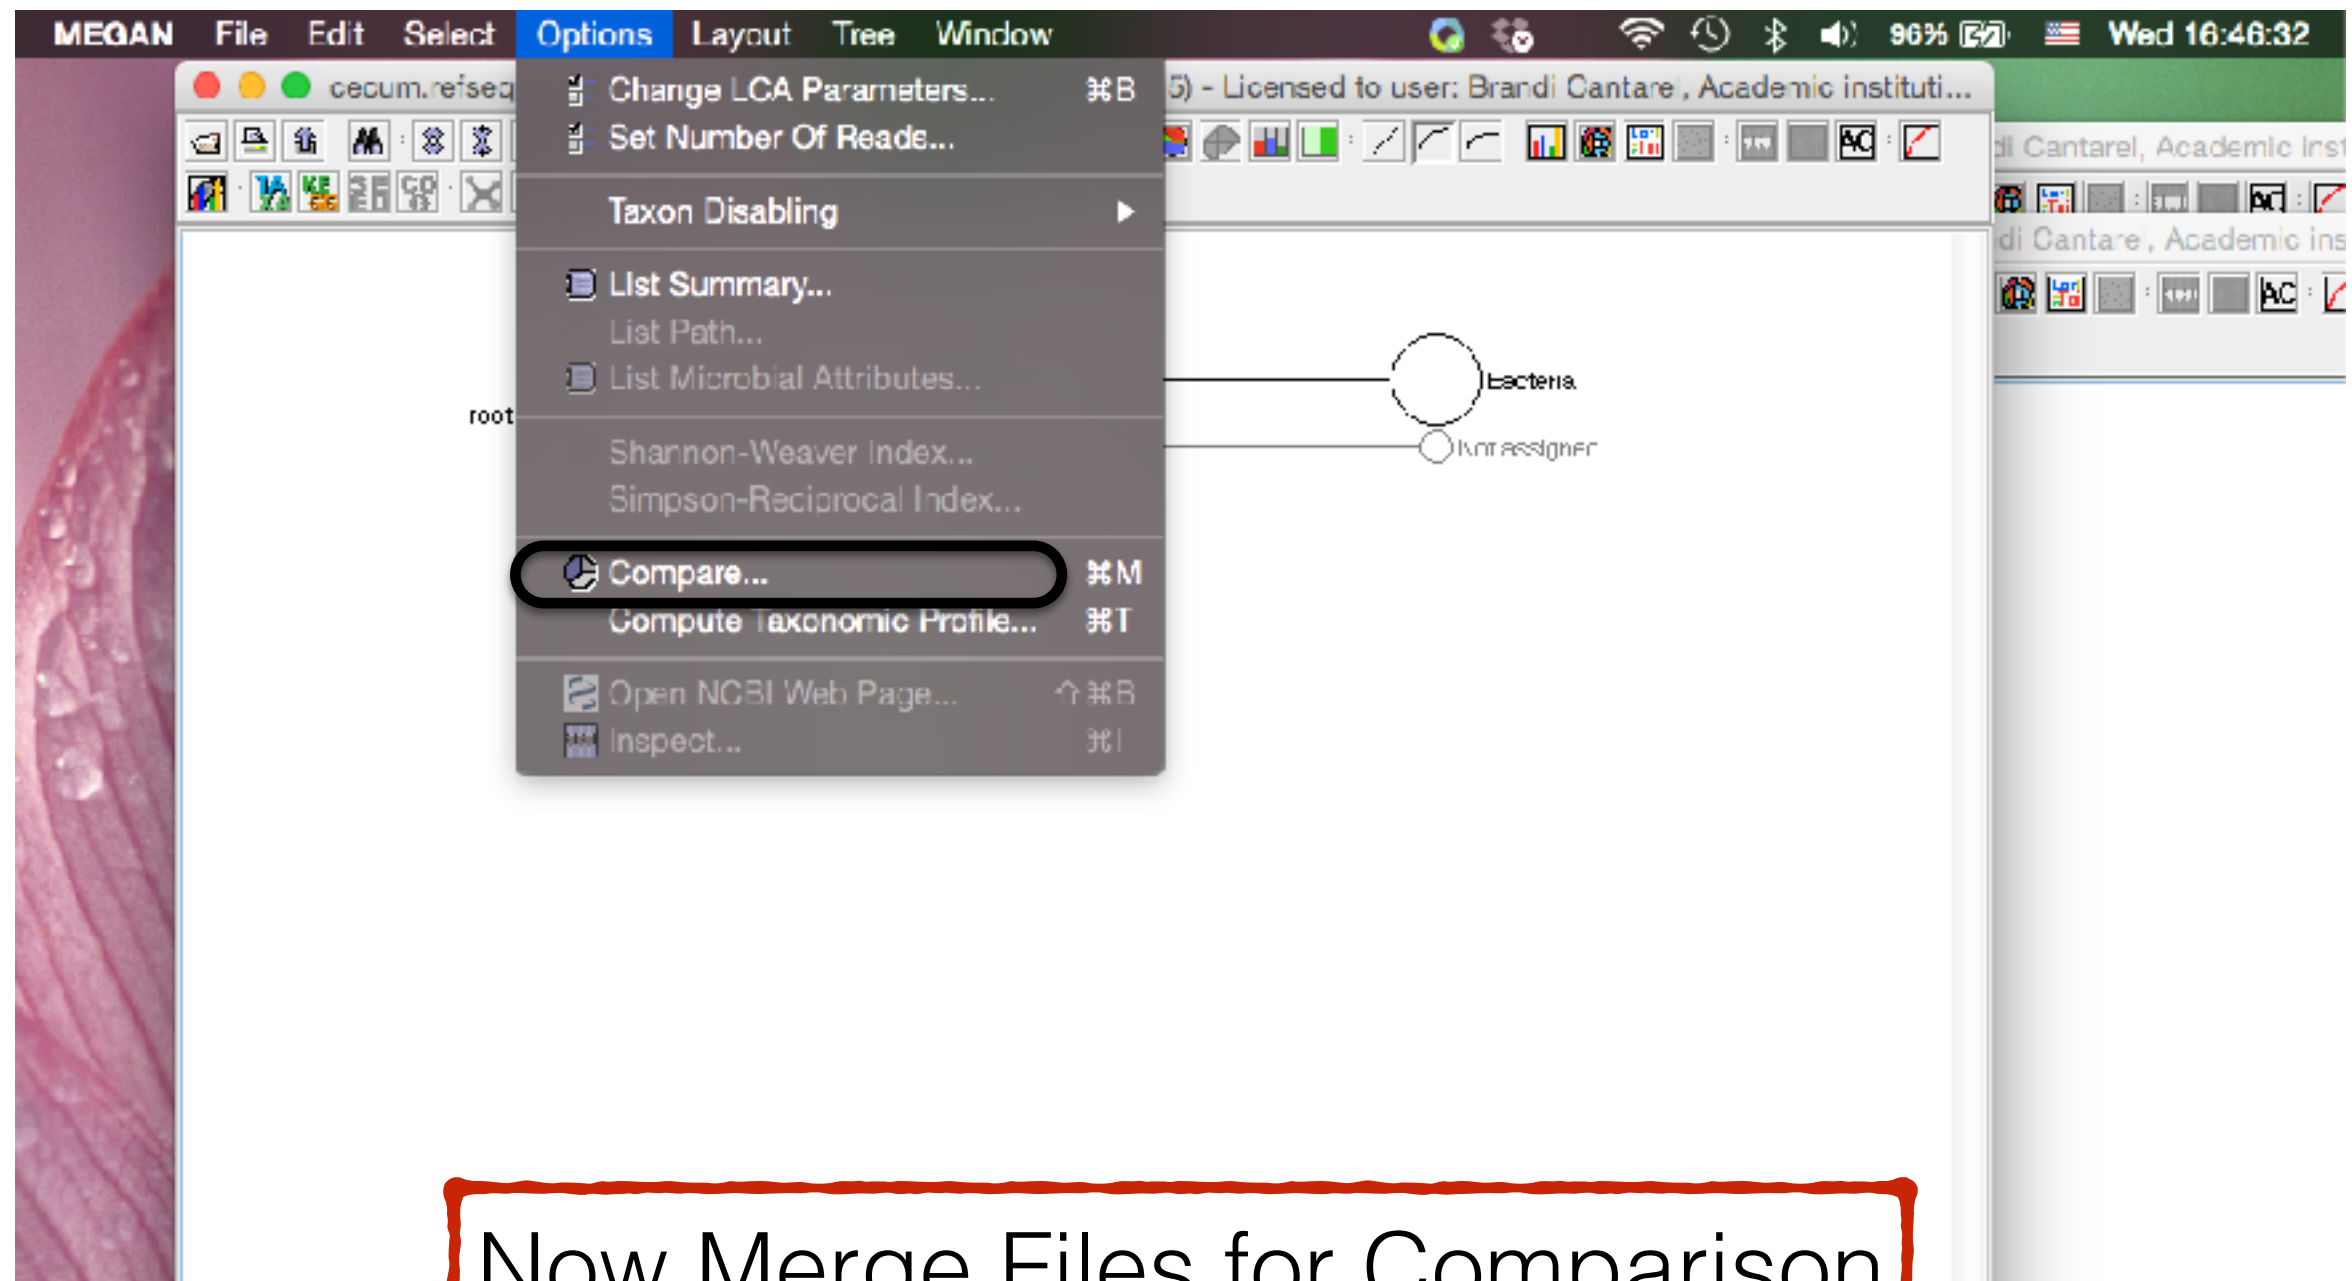

Visualization Options

Cluster Analysis

Now Merge Files for Comparison

Select all files and select normalized counts

Taxonomer

- Go to web site: <https://www.taxonomer.com/>
- Login as me: b.cantarel@gmail.com
- Password pfb2016
- Select the Project PFB2016
- Select a WGS Sample For Comparison with Mother Results

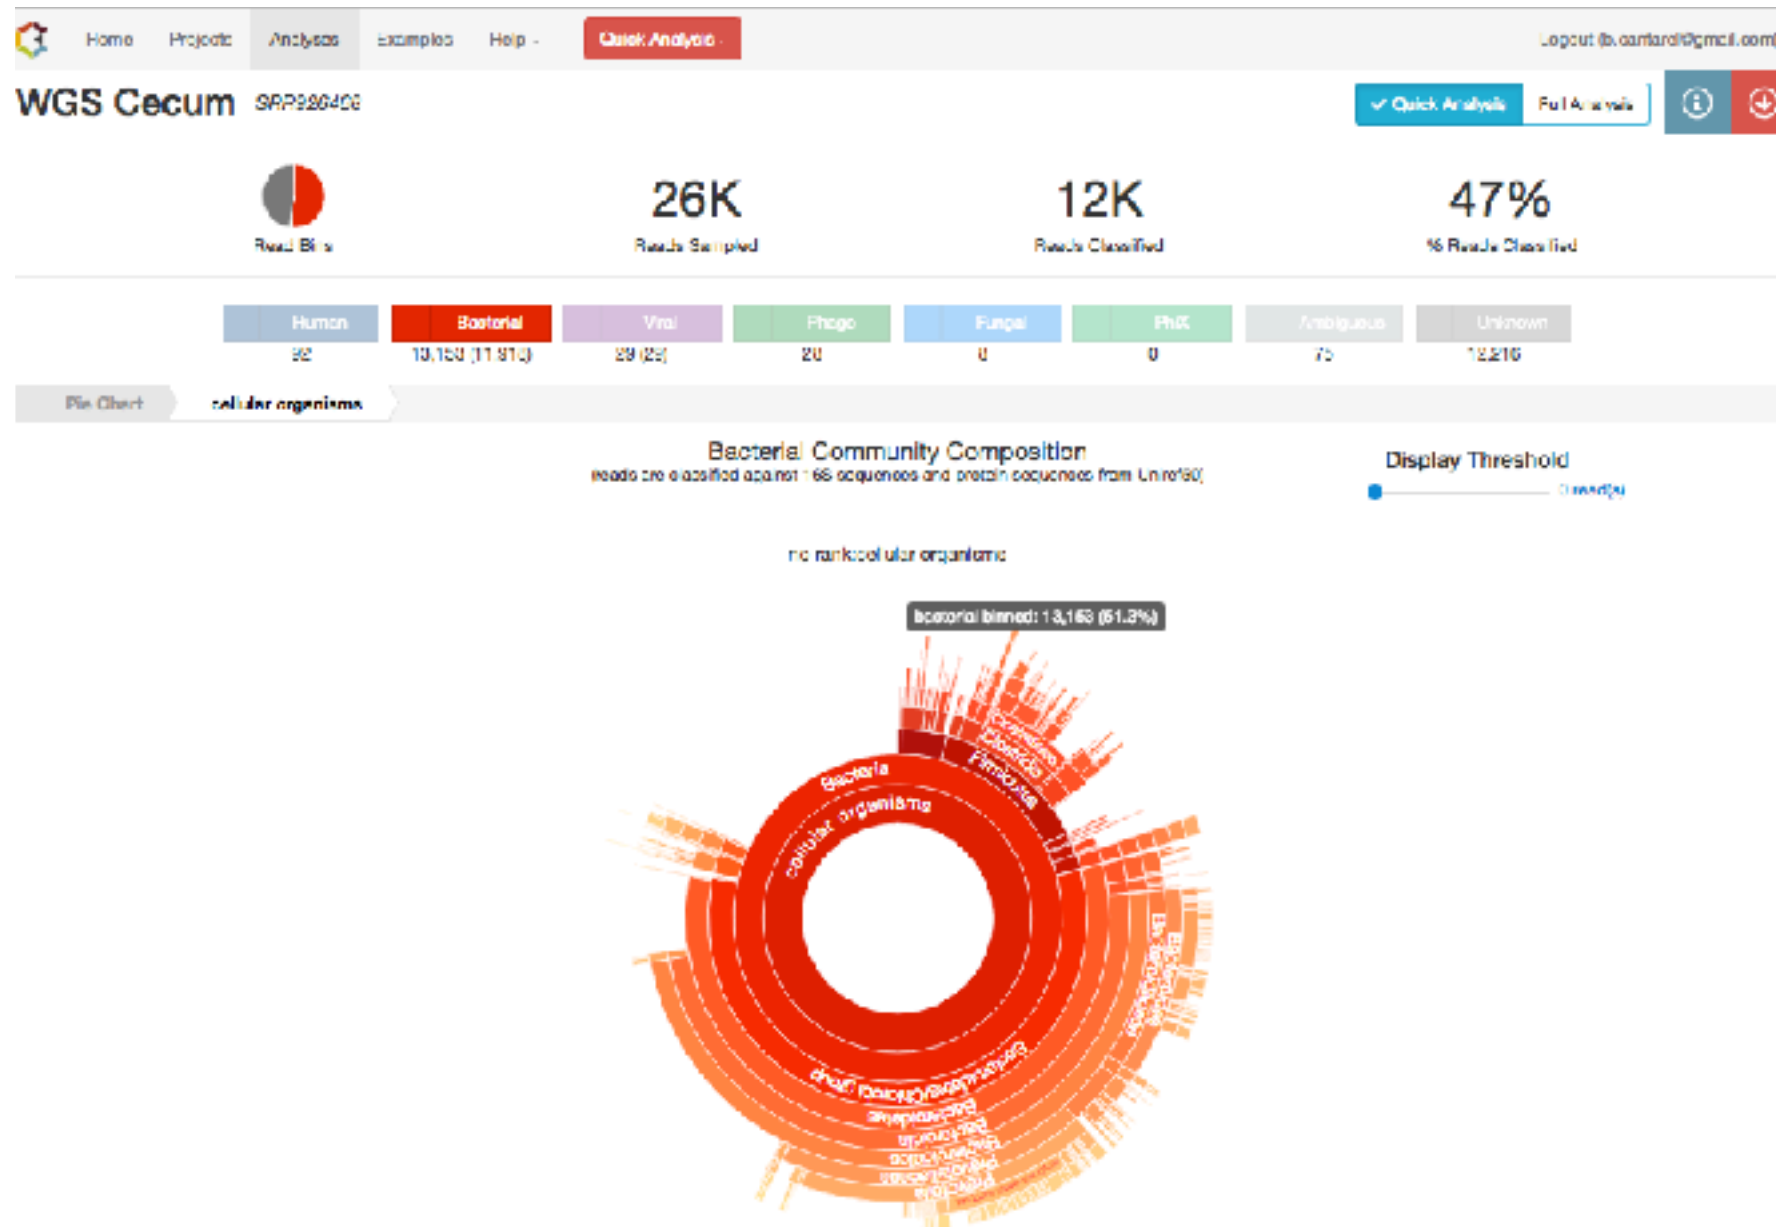

The screenshot shows the Taxonomer web application interface. At the top is a navigation bar with links: Home, Projects, Analyses, Examples, Help, and a red 'Quick Analysis' button. The user is logged in as 'b.cantarel@gmail.com'. Below the navigation bar is a 'Get Started' section with three buttons: 'Try an example analysis' (red), 'Analyze your sequencing data' (yellow), and 'Create a project' (blue). Below this is a 'Recent Analyses' table with columns: Name, Description, Project, Full Analysis Status, Created By, Date Created, Edit, and Delete. The table lists five analyses, all created by 'Brandi Cantarel' on '10/17/2016'. The 'WGS Ileum' analysis is highlighted with a blue border. Below the table is a 'Recent Projects' section with a table listing projects. The 'PFB2016' project is highlighted with a blue border.

Name	Description	Project	Full Analysis Status	Created By	Date Created	Edit	Delete
Pig 16S Ileum	pig59_ileum_med_16S_illum	PBF2016		Brandi Cantarel	10/17/2016		
Pig 16S Colon	pig59_colon_med_16S_illum	PBF2016		Brandi Cantarel	10/17/2016		
Pig 16S Cecum	pig59_cecum_med_16S_illum	PBF2016		Brandi Cantarel	10/17/2016		
WGS Colon	pig59_colon_med_meta	PBF2016		Brandi Cantarel	10/17/2016		
WGS Ileum	pig59_ileum_med_meta	PBF2016		Brandi Cantarel	10/17/2016		

Name	Description	# of Analyses	Created By	Date Created	Edit
PBF2016	Programming for Biology 2016	8	Brandi Cantarel	10/17/2016	

Taxonomer

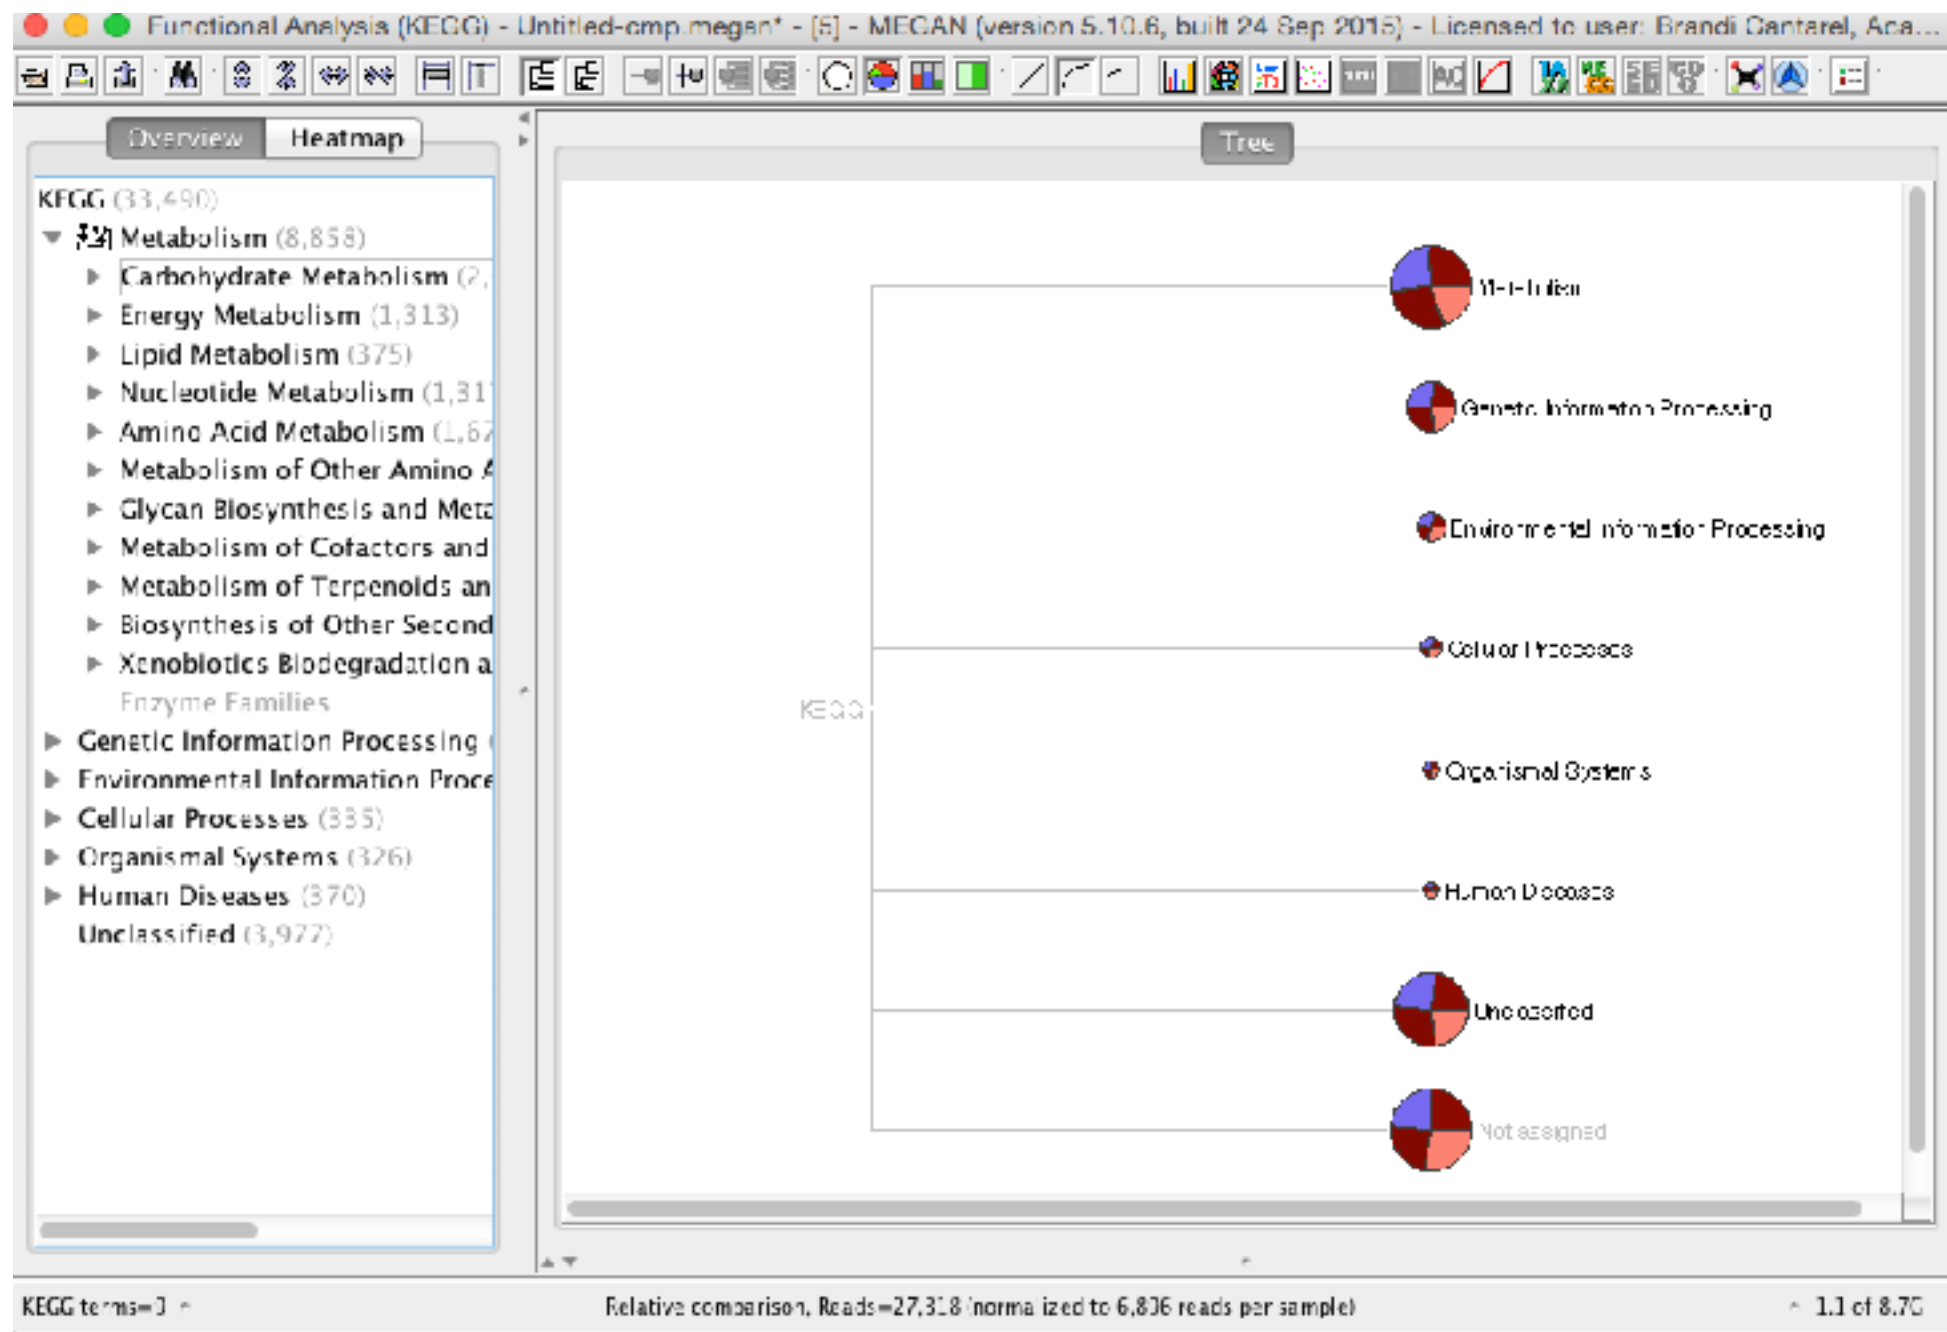

- You will see something similar to the page on the right
- You can hover over each classification to get the number of reads assigned or click to see the subset of the data

WGS Taxonomic Comparison

- What are the dominate phyla, family and genera for each sample?
- Are these dominate taxa consistent with 16S results?
- Are sites that are closer (spatially) also closer taxonomically (use cluster analysis)?
- What fraction of each samples is “unclassified” taxonomically?
- Are the taxonomer results similar to the Megan and Mothur results for your chosen sample and bodysite?

Functional Exploration

Functional Exploration

- Pick a pathway from Carbohydrate Metabolism or Glycan Biosynthesis and Metabolism.
- How does the abundances of the genes in your pathway compare between the 4 body sites?
- Now pick a pathway from Genetic Information Processing
- Are the abundances more or less similar between body sites in your chosen sugar metabolism pathway compared to Genetic Information Processing?
- Run KEGG Cluster analysis, how does functional clustering compare to clustering by Taxa?
- What fraction of each samples is “unclassified” functionally?

Explore the Mothur 16S Analysis:

- Plot the PCoA (R or excel)
 - *.axes* is the PCoA analysis, samples can be plotted by the axis1 vs axis2
 - How does the unifracs (final.phylip.tre1.weighted.ave.pcoa.axes and final.phylip.1.unweighted.ave.pcoa.axes) compare to the distance plot (final.an.unique_list.thetayc.0.03.lt.pcoa.axes), are the same samples grouped together?
 - More about Unifrac <http://aem.asm.org/content/71/12/8228.full>
- Open the SVG files in your web browser
 - How do the different distance methods differ in their heatmap?
- Rarefaction is a method for assess species richness, plot the rarefaction (R or excel), using the file final.an.unique_list.groups.rarefaction
 - The first column represents the number of sequences samples and each column represents the number of OTUs observed when randomly selecting that many reads
 - How does this compare to the Megan results, how many samples are needed to reach OTU saturation?
